

Course Addendum: Changes to 2020/21 Teaching In Response to Covid-19

Whilst we hope to deliver as much activity on-campus as possible, the government's guidance and social distancing measures will inform how much teaching we can deliver face-to-face in the 2020/21 academic year. Working to government guidelines we have adapted the delivery of our courses to a model of blending learning, which consists of a mix of online and on-campus activities. We are equipped to move between blended learning to fully online, or face-to-face, as the Covid-19 situation evolves.

The learning outcomes of your course remain the same but there are changes to its delivery, assessment and structure, as set out in the Changes section of this document. The subsequent pages of this document contain the original teaching and learning schedule of this course, for your reference.

24th July 2020

Course Details

Course Title(s)	BSc (Hons) Biomedical Science
Course Code(s)	5578
Course Director	Eiman Aleem
Shared Modules?	Yes

Year/Level/Module	Changes to delivery mode	Changes contact hours (%)	
		Current	New
L4 (S1)	<p>The following general changes are made to the delivery of the modules at L4, 5 and L6 in S1:</p> <p>Face to face lectures are replaced by synchronous online lecture sessions and supplemented synchronous tutorials and asynchronous online support materials such as forum discussion.</p> <p>For some modules there will be onsite laboratory sessions.</p>	Lecture Laboratory Seminar Self-Directed Online sessions	18% 0-6% 6% 75-82% 0-6% 64-70% 30%
Module specific changes L4 (S1): ASC_4_487 Chemistry for Life		Lecture Laboratory (onsite) Seminar Self-directed Online sessions:	18% 6% 76% 0% 64% 30%

ASC_4_498 Human Anatomy and Physiology.		Lecture Laboratory (onsite) Seminar Self-directed Online sessions:	18% 3% 79%	73% 27%
ASC_4_488 Biochemistry		Lecture Laboratory (onsite) Seminar Self-directed Online sessions:	18% 6% 76% 0%	6% 64% 30%

Original Course Specification

For reference, the following pages contain the original teaching and learning schedule of this course, prior to the changes implemented in response to Covid-19.

	External	Subject Benchmark Statement for Biomedical Sciences (QAA, 2015) Framework for Higher Qualifications (QAA, 2014) SEEC Credit Level Descriptors 2016 Criteria and Requirements for the Accreditation and Re-accreditation of BSc (Hons) degrees in Biomedical Science (Ed. 2.4, 2016)

B. Course Aims and Features

Distinctive features of course	<p>This innovative programme is designed for those students wishing to pursue careers in medicine, laboratory-based biomedical research, pharmaceutical and biotechnology industry, or in Science policy, and regulatory professional bodies. <i>"An honours degree in Biomedical Science accredited by the IBMS is acceptable as a preliminary academic qualification for registration with the Health and Care Professions Council (HCPC). By undertaking a period of laboratory training and completion of the Institute's Registration Training Portfolio for the award of a Certificate of Competence, individuals are able to demonstrate they meet the fitness to practice standards (HCPC Standards of Proficiency) required for registration as a biomedical scientist. The degree gives eligibility for Licentiate membership of the IBMS"</i> (Criteria and Requirements for Accreditation and Re-accreditation of BSc (Hons) degrees in Biomedical Science (Ed. 2.4, 2016).</p> <p>The course provides an integrated approach towards understanding and in-depth knowledge of human health and disease. The interdisciplinary nature of this course is reinforced by broad departmental expertise in areas of cell and molecular biology, microbiology, human anatomy and physiology, and clinical OMICS and precision medicine. Students will acquire knowledge, intellectual and practical skills to understand human disorders and means of disease diagnosis and treatment through laboratory testing.</p> <p>A distinctive feature of the course is that it introduces the students to state-of-the-art tools used in precision medicine, such as bioinformatics, genomics, transcriptomics, proteomics, and high-throughput drug screening geared towards molecular target identification and targeted therapeutics. Furthermore, students will be trained to apply their knowledge to offer solutions and to develop opportunities in a wide range of industries that require a broad understanding of biomedical science.</p> <p>The course has been designed to allow focus in particular areas, including clinical sciences, entrepreneurship, ethics and law, in addition to the central themes of biomedicine. Through carefully guided optional modules, students will be able to pursue their area of particular interest whilst core modules ensure attainment of knowledge and understanding of key concepts and contemporary perspectives across the biomedical science. After completion of the course, students may apply for medical school if they meet all the criteria required for(graduate entry medicine, or pursue</p>
---------------------------------------	---

	<p>careers in biomedical research, pharmaceutical industry, or science policy and ethics.</p>
Course Aims	<p>The BSc (Hons) in Biomedical Science aims to:</p> <ol style="list-style-type: none"> 1. Enable students to understand the biology of human health and disease, including the basic knowledge of human anatomy and physiology, cell biology, genetics and molecular biology, biochemistry, immunology and microbiology. 2. Provide students with practical and laboratory skills relevant to the field of biomedical science and enable them to design and carry out an independent research project. 3. Provide the knowledge and understanding of disease processes in the context of laboratory investigations through clinical modules such as cellular pathology and imaging, clinical biochemistry, haematology, and blood transfusion. 4. Provide competency in data analysis, statistics, numeracy, an overview of big data analysis, and health informatics through the modules of bioinformatics and biostatistics, and clinical OMICS and precision medicine. 5. Make students aware of employability pathways early on, and develop their leadership skills, analytical thinking, critical evaluation, team work, time management, negotiation skills and communication skills, particularly those from local areas in accordance with the policies and practice of equality and diversity. 6. Develop students' awareness of the need for compliance with health and safety policies, good laboratory practice, risk and COSHH assessments, the Human Tissue Act and the importance of quality control and quality assurance. 7. Provide the opportunity for students for future training as accredited Biomedical Scientists, as conferred by the Institute of Biomedical Science, in recognition of their competencies in this subject.
Course Learning Outcomes	<p>On successful completion of the course:</p> <p>A. Students will demonstrate knowledge and understanding of:</p> <p>A1. The basic biology of human health and disease represented by the disciplines of human anatomy and physiology, cellular, genetic and molecular biology, microbiology, chemistry and biochemistry;</p> <p>A2. Basic principles of laboratory-based diagnostic and analytical techniques used in clinical pathology, human haematology and immunology, clinical biochemistry and blood transfusion;</p> <p>A3. Aetiology, progression, and diagnosis of human diseases to support clinical management and treatment selection;</p>

	<p>A4. Bioinformatic and statistical principles for analysis of big data for the study of genomics, proteomics and transcriptomics, and their application in precision medicine;</p> <p>A5. Research design, quantitative/qualitative methods, critical review of evidence in the biomedical sciences, data interpretation, reporting, biosafety, ethics and conduct.</p> <p>B. Students will develop their intellectual skills such that they are able to:</p> <p>B1. Apply theories, paradigms, concepts or subject-specific principles to a new context;</p> <p>B2. Obtain and integrate lines of subject-specific evidence to formulate hypotheses, design experiments, critically evaluate data and use it to develop a research proposal;</p> <p>B3. Demonstrate independence of thought to identify the key features of a problem and suggest possible means of investigation;</p> <p>B4. Keep abreast of current insights in core and specialist areas of biomedical science;</p> <p>B5. Recognise the moral and ethical issues of investigations and appreciate the need for ethical standards and professional codes of conduct;</p> <p>B6. Synthesise, analyse and summarise a body of information and come to an informed and logically consistent conclusion.</p> <p>C. Students will acquire and develop practical skills such that they are able to:</p> <p>C1. Demonstrate competence in the basic experimental skills relevant to cell and molecular biology, human anatomy and physiology, microbiology, cellular pathology and imaging, clinical biochemistry and blood transfusion;</p> <p>C2. Demonstrate knowledge of quality assurance and quality control principles, hazard identification, risk assessment and safety procedures associated with a particular technique or methodology;</p> <p>C3. Select and apply appropriate techniques, and evaluate alternative methodologies for an investigation or to complete a process;</p> <p>C4. Undertake practical investigations in a responsible, safe and ethical manner, while observing relevant health and safety regulations;</p> <p>C5. Organise and allocate duties, set targets and evaluate progress in achieving specific technical goals, evaluate own performance and performance of others within a team;</p>
--	--

	<p>C6. Use relevant numerical quantitative techniques and demonstrate competence in bioinformatic and statistical methods to validate, calibrate and analyse big data;</p> <p>C7. Present data in seminars or small-group tutorials to develop interpersonal skills such as information retrieval, problem-solving, communication and team working;</p> <p>C8. Demonstrate competence in the use of word-processors, spreadsheets; biological databases and data presentation packages.</p> <p>D. Students will acquire and develop transferrable skills such that they are able to:</p> <p>D1. Identify individual and collective goals and responsibilities;</p> <p>D2. Develop the ability to work on one's own initiative, and manage one's own time to meet deadlines;</p> <p>D3. Develop negotiation skills, and lifelong learning in the field of biomedical science including enterprise and knowledge transfer skills;</p> <p>D4. Provide reflective and evidence-based solutions to problems;</p> <p>D5. Recognise and respect the views and opinions of other team members;</p> <p>D6. Evaluate their own performance as an individual and as a team member, as well as the performance of others;</p> <p>D7. Develop a flexible and effective approach to study and work;</p> <p>D8. Communicate ideas, arguments and concepts in a rational and systematic way, using a variety of media;</p> <p>D9. Clearly communicate in writing for both academic and lay audiences;</p> <p>D10. Use the full range of sources of information, citing references properly and avoiding plagiarism.</p>
--	--

C. Teaching and Learning Strategy

- i) The teaching and learning (T&L) strategy employed in the course is designed to encourage a progressive approach towards the acquisition of subject knowledge and practical skills in a gradual manner, thus leading the students from a greater level of support provided in level 4 towards a more independent and self-directed learning at level 6.
- ii) Teaching and learning activities vary based on the module aims and learning outcomes. All modules offered at level 4 provide the basic background of Chemistry, Cell Biology, Biochemistry, Human Anatomy and Physiology, Genetics and Molecular Biology, and Microbiology (A1) through a blend of keynote lectures, tutorials, group work, flipped learning, and problem-based learning activities. Many of the first year modules develop and assess practical skills for which students have to demonstrate competence. The laboratory-based

practicals will predominantly use approaches that engage students through structured laboratory demonstrations, practical experiments, group work, and problem-based learning.

- iii) After students gain the fundamental background in core biological subjects at level 4, they will be introduced at level 5 to modules dealing with aetiology of human disease, disease progression, diagnosis and treatment (A2 and A3). During level 5, the students will be also introduced into essentials of Bioinformatics and Biostatistics (A4), and into Skills for Biomedical Scientists; both allow an assessment of student ability in Mathematics, Statistics, Bioinformatics and English. The social and ethical context of Biomedicine also begins in the Skills for Biomedical Scientists module where students discuss case studies on some aspects of scientific ethics. The latter emphasises critical review and argument development using exercises, and also reviews current key biomedical issues (A5). This module also begins the student's induction into the scientific method (A5). The latter is further developed in the third year (level 6) in the Project module, which concentrates on data analysis and presentation, including accessing and review of published sources. This module provides additional practice and assessment of scientific writing, and the students have to research and develop a workable project proposal to be conducted in their final year (A5). At level 5, each student will select two optional modules relevant to the career pathway of their choice.
- iv) At level 6, students will continue to receive training in clinical sciences such as in Clinical Biochemistry and Blood Transfusion, that provides them with necessary skills to perform diagnostic tests in hospitals or in clinical laboratory settings. The Bioinformatics and Biostatistics module offered to the students at level 5 serves as a background (prerequisite) for the Clinical OMICS and Precision Medicine module at level 6 (A5). The latter deals with current technologies in genomics, transcriptomics, and proteomics used in precision medicine for diagnosis, patients' stratification and treatment options. This module will also introduce the students to the basics of systems biology (A5). In addition, students will select two optional modules relevant to the career pathway of their choice.
- v) Lectures will convey major elements of the subject-specific content, and provide explanations of difficult concepts. Lectures will facilitate the development of students' active listening skills, and enable them to appreciate how information is structured, and presented. Additionally, lectures will involve computer-based aids, and multimedia, as well as will encourage the interactive participation of students in groups.
- vi) A schedule of personal tutoring monitors student progress especially during the first year and is informed by student progress on the Skills for Biomedical Scientists module. The details of this and the action taken by the student to address any weaknesses will be recorded (see Appendix B).
- vii) All modules employ teaching methods that encourage students to consider and challenge the evidence with which they are presented. The assessment schedule requires students to question and evaluate the arguments surrounding some key concept or principle. This may be formally assessed or simply part of group discussions, debates or as part of some problem-solving exercises. Biology of the Cell, Biochemistry, Genetics and Molecular Biology at level 4 introduce the students to current thinking over a range of rapidly developing areas in biology and biomedicine, and to look at the different approaches being adopted to analyse these in a series of in-class workshops and coursework tasks (B1and B2). Skills for Biomedical Scientists at level 5 and the Project module at level 6 have specific lectures on how to approach the primary literature and evaluate the evidence presented (B1, B2, B3, B4). This is assessed by the project proposal the student is required to generate as part of this module (B2), in preparation for their final year, and which must include a preliminary experimental design (B2, B3). The topics selected for the research proposal must be current and up to date, thus requiring the students to keep abreast of current insights in core and specialist areas of biomedical science (B4). Additionally, the research proposal will have to be

approved by the research ethics committee at the School, thus requiring the students to recognise the moral and ethical issues of investigations and appreciate the need for ethical standards and professional codes of conduct (B5). The final year project report must finish by placing the findings in the context of current thinking (B6).

- viii) Laboratory skills and technical proficiency in analytical methods are developed from the first year to the third year modules through practical elements that offer subject-specific techniques (C1, C2 and C3). This is further reiterated during the final year Project.
- ix) A key emphasis of the Biomedical Science programme is the development of the student's practical and analytical skills through subject-specific and generic practicals. Students are inducted into teamwork skills, and into health and safety regulations, and their evaluation from their first sessions in Skills for Biomedical Scientists (C4). Part of their assessment is to evaluate their performance and that of their group, to encourage them to be reflective about their approach (C5), and to manage their activity to best effect.
- x) Skills in Biostatistics and Bioinformatics, and *in silico* approaches to practical work are developed at level 5 to analyse big data through the use of relevant biological databases (C6).
- xi) Presentation skills are practiced from level 4 and extend up to level 6 in most modules. Group work, including the use of wordprocessing software, spreadsheets and presentations that review recent scientific literature, features in several subject-specific modules at level 5 and 6 and in the project module (C7 and C8). Skills for Biomedical Scientists and subject-specific modules encourage the students to consider alternative ways to approach specific problems, or to address specific questions (C1, C2, C3), typically through their practical work. In this way we are able to build student confidence in their technical and practical skills and reinforce the basic concepts delivered in the associated lecture programme.
- xii) The transferable skills are fully mapped through the curriculum, principally through the core modules. Career Management Skills will be offered as a workshop at level 4, in which the course team and representatives from relevant sectors will give talks about career options and skills required for different career pathways. The workshop will also involve group work facilitated by staff members to help the students identify individual goals (D1), and to introduce them to negotiation skills and self-development skills (D3). This is to ensure that personal development planning is mapped throughout the course, is obvious and transparent to the students and is fully supported by the personal tutoring system from the first year. There is also subsequent testing of scientific writing skills (D9) and preparation for researching future possible careers. A number of further tasks assessed in Skills for Biomedical Scientists measures student progress in managing their own learning (D2) and students are required to assume responsibility for this, under the guidance of their personal tutor. In-class worksheets, problem-solving exercises and group-based work at level 4 and level 5 provide rapid feedback and encourage students to review and develop their approaches to their learning (D4, D7). Across most modules students are required to work in teams, and to present in front of peers to develop communication skills (D8), the skills of respecting opinions of other team members (D5), and the skills of evaluating their own- and others' performance (D6). Through preparing their final year project students will learn to cite references and avoid plagiarism (D10).
- xiii) During the sandwich program work-based placement will take place. Further, if collaborative agreements exist with other national or international biomedical laboratories, students may spend a year there to perform experiments necessary for their final year research project. A staff member from the biomedical science team at LSBU will co-supervise the project together with the group leader from the collaborating laboratory. Either the research or work-based placement will provide the students with the opportunity to apply the intellectual (B1-6), the practical (C1-8), and transferable skills (D1-10) acquired throughout the program, and will

prepare them for their chosen careers. More details about placement options and their relationship to the career pathway chosen by students are provided on pages 12 and 13 of this document.

- xiv) Digitally Enhanced Learning will be incorporated into the T&L strategy to develop and support learning. Examples will include the University VLE (moodle), Panopto lecture capture and on-line formative assessment platforms, discussion groups and remote tutorial support.
- xv) Students will be expected to engage in independent learning as outlined in each of the module descriptor documents which will be made available on the Moodle sites. Where appropriate this learning will be guided by staff via tasks set in class and on the VLE.
- xvi) A wide range of subject-related resources are available within the LSBU Library. These reflect a typical academic repository that includes access to textbooks, licensed E-journal subscriptions, scientific databases, interactive e-learning platforms, and multimedia. Moreover, students have access to site-licensed software and assistive technologies to support their learning (if registered for Disability and/or specific learning difficulties).
- xvii) The current infrastructure is well equipped to support the course. There are a total of 4 teaching and research laboratories that provide a rich learning environment for combining theory and practice. Each contains state-of-the art equipment to support delivery across all core and specialist modules.
- xviii) The staff that will teach on the programme comprise: 1 Professor, 4 Associate Professors, 4 Senior Lecturers, and one Lecturer (at the time of writing). Contributions to the programme may also be made by guest lecturers, hourly paid lecturers and Postdoctoral trainees. All staff are appropriately qualified and where Postdoctoral trainees are involved they will be appropriately trained and supervised.

D. Assessment

- i) Assessment will be progressive in terms of level and content and leads to effective feedback to enable development of students' knowledge and skills as per the subject benchmark statement-biomedical sciences-2015.
- ii) The course will use a blend of formative and summative assessment, as well as self- and peer assessment. Formative assessment will provide structured feedback to support students in the summative task, therefore scaffolding the approach to assessment and ensuring appropriate development of critical thinking, academic writing, practical and technical comprehension, and creativity.
- iii) Students experience variety of assessment during their first and second years, including testing of their practical and analytical skills through level 4 modules' coursework, practice tests and laboratory reports. Proficiency in Mathematics and English is assessed during the Skills for Biomedical Scientists, and the Bioinformatics and Biostatistics modules (A4). Knowledge is tested by unseen written examinations in as well using essays or problem solving exercises across the modules (A1, A2, A3).
- iv) Level 5 and 6 assessments is a combination of examination, a variety of coursework, including presentations, essays, in-class problem-solving exercises and calculations (A4), devising of experiments (A5), case studies and a final year project (A5). The latter develops out of an extended literature search and initial experimental design (project proposal) submitted at level 5 within the Skills for Biomedical Scientists module.

- v) Most examination papers at level 5 and all at level 6 also demand the intellectual skills, as do coursework essays and extended essays at level 6. Real world problem-based learning exercises at all levels typically require students to work individually or collectively by applying their understanding of current thinking or methodologies to a new context (B1, B2, B3).
- vi) Assessments in both the Bioinformatics and Biostatistics, and the Skills for Biomedical Scientists modules require the students to demonstrate their competence using the range of bioinformatics tools, and statistical methods using worksheets completed on regular basis in compulsory workshops (C6, C8). These tests are completed and students receive their corrected work and a model answer the following week. The rest of the assessment for the latter module requires students to produce a viable experimental design through discussion with their supervisor, in preparation for their final year project (C2, C3, C4, C5).
- vii) Their capacity to summarise and critically evaluate methodologies is assessed in the Project module at level 6 (C2, C3, C4, C5, C7, C8). The Project module also seeks to establish good investigative techniques, by applying skills and attributes acquired in other modules, and as a result of working in close association with a supervisor on a well-defined experiment (C3). The assessment here requires the student to keep a contemporaneous lab book and to produce a paper close to submission standard, and defend this in a viva voce examination (C1-C8).
- viii) A range of modules at level 4 and 5 require students to manage a task and to be able to communicate their findings to their cohort. Skills for Biomedical Scientists requires them to summarise the recent scientific literature on a topic and use this to develop a hypothesis and associated experimental design. Some of the higher level attributes are only fully assessed at level 6 in the largely independent work in the Project (D1, D2, D4, D8). These require a flexible approach to data acquisition, interpretation and presentation, and the use of a full range of sources of information and proper citations (D7, D10). The development of a research proposal and establishing an investigation protocol begins in Semester II of the second year as part of the assessment of Skills for Biomedical Scientists (D1, D2, D8, D9).
- ix) Presentations, debates and seminars are used extensively at each level and through feedback, students are encouraged to polish these skills up to their final year (D4, D8, D9). The case studies in Skills for Biomedical Scientists assesses the student's ability to argue logically on a topic in scientific ethics (C2, C4). Once again, many of these skills and attributes are brought together to complete the final year Project (D1-D10), and the assessment of these are one of the principal elements by which the graduate status of the student is assessed.
- x) Table 3 (below) shows how the course will be assessed by module. All career pathways share a similar variety of summative assessment, with all comprising coursework (written essays, oral presentation, oral discussion, or group work) and the majority also include a final exam. Most modules carry several points of assessment; however in some, there are sub-components of the coursework comprising a blend of assessments (eg, practical demonstration + essay, or oral presentation + module viva). In the Research Project module, 50% of the overall assessment will be for the 4000-5000- word dissertation, 15% for the interim report, 20% for the project management, and the viva voce of the work will constitute 15% of the overall summative assessment for this module.
- xi) In order to obtain an award, students must pass all required modules (for the relevant award: CertHE; DipHE; Honors Degree) and gain the required number of credits as stated in the LSBU regulations.

E. Academic Regulations

The University's Academic Regulations apply for this course. . Any course specific protocols will be identified here.

F. Entry Requirements

In order to be considered for entry to the course, applicants will be required to have the following qualifications:

Level 4

2020 entry

- A Level: BCC to include Biology and a second STEM subject or;
- BTEC National Diploma DMM ideally with a good Biology profile or;
- Access to Science with 39 Merits and 6 Passes including 12 credits in Science related subjects or;
- Equivalent level 3 qualifications worth 104 UCAS points
- Applicants must hold 5 GCSEs minimum grade C including Maths, Biology and English or equivalent (reformed GCSEs grade 4 or above).
- We welcome qualifications from around the world. English language qualifications for international students: IELTS score of 6.0 or Cambridge Proficiency or Advanced Grade C.

Direct Entry to Level 5

Students with the knowledge and skills equivalent to the required learning outcomes for Level 4 modules of the BSc (Hons) Biomedical Science will be encouraged to make direct entry to Level 5. Such knowledge and skills should be commensurate with those identified in the **Policy** and Procedures for the Accreditation of Prior Learning (APEL), of London South Bank University APEL, and in the guidelines on levels and learning outcomes produced by the South East of England Consortium for Credit Accumulation and Transfer (SEEC/CAT, May 1996, SEEC Credit Level Descriptors for HE, 2010).

G. Course structure(s)

Course overview

Awards are given in accordance with current London South Bank University Academic Regulations for Taught Programmes. The overall modular structure of the BSc (Hons) Biomedical Science is shown in Figure 1. Thirteen core modules (total credit accumulation: 280 credits), including a Research Project (40 credits) will be common to three career pathways. In addition, four optional modules (total credit: 80 credits) will be required to be selected by students in level 5 and level 6 from each career pathway; one optional module in each semester (Table 1). The three career pathways are; i) Applied Medical Sciences, ii) Pharmaceutical and biotechnology industry, iii) Regulatory sector and Science policy (please see the course specifications and rationale for details). For the sandwich program, the same regulations will apply except that the students will be placed for a year between level 5 and level 6 at either a company, NHS or research laboratory in a different organization.

The academic year will run as usual in two Semesters from September to June.

The degree will be offered in both FT (3 years) and sandwich modes (4 years). Details of modular structure are shown in Figures 1 and Tables 1 and 2 below.

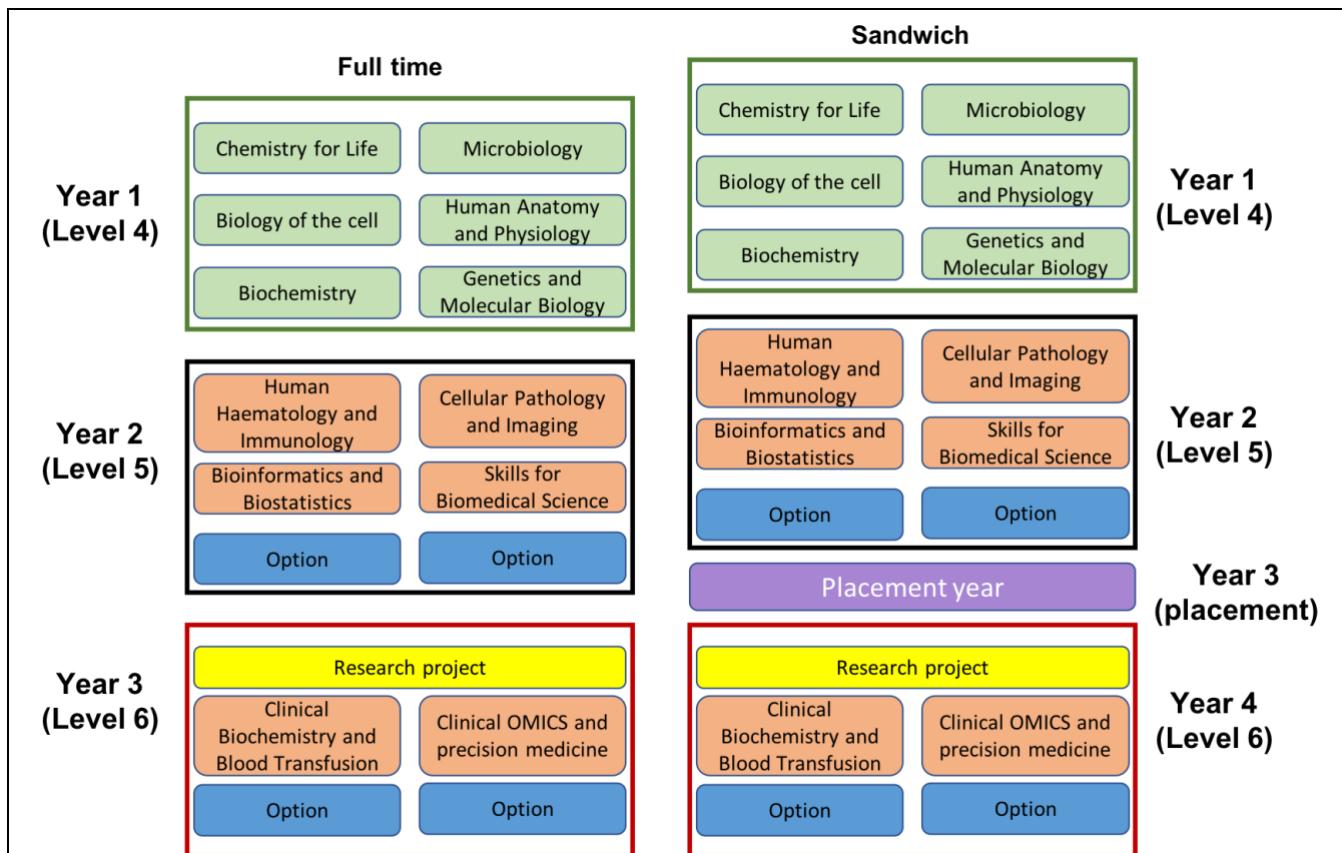

Figure 1. Course Structure for BSc (Hons) Biomedical Science. Both Full time and Sandwich programmes are shown.

Option modules

There will be a flexible approach to selecting Options. At the same time, these Option modules will form coherent “career pathways” within the course structure, so their individual selection will be

defined by the students' interests. It is intended that the students will meet with their personal tutors and discuss their personal career plans to ensure the selected Options are appropriate and meet their individual aspirations. Four Option modules are included in the Module Descriptor document (at the time of writing). These modules meet the credit requirements of one of the three pathways shown in Table 1. Additional Option modules will be developed as the course is developed.

Table 1. Optional modules for BSc (Hons) Biomedical Science.

“Career Pathway”	Level	Option
Applied Medical Sciences	5	Introduction to Pharmacology and Toxicology, Public Health, Cancer Biology and Therapy, The Cardiovascular system, Stem Cells and Developmental Biology
	6	Diabetes and Endocrine disorders, Clinical nutrition, Neuroscience and Aging, The Microbiome, Current Perspectives in Bioscience
Pharmaceutical and Biotechnology Industry	5	Introduction to Pharmacology and Toxicology; Bioreactors, Cancer Biology and Therapy
	6	Drug Design and Development, Current Perspectives in Bioscience, Entrepreneurship
Regulatory Sector/Science Policy	5	Public health; Ethics and Law
	6	Current Perspectives in Bioscience, Legal skills and intellectual property rights

Placements information and employability

Maximising graduate employment opportunity is a central consideration in the design of the proposed career pathway(s) in Biomedical Science. In addition to the array of graduate skills, both transferable and subject-specific, that the course is providing throughout the modular structure, a graduate employability workshop will be offered during Level 4. This workshop will host representatives from diverse professional bodies. The purpose of this workshop is to help the students identify the career pathway they want to pursue from the first year of their studies. The workshop will also include talks highlighting relevance of learning to employability, and practical skill acquisition in presentation, CV writing and communicating to diverse audiences.

In addition, an optional ‘sandwich year’ with placement opportunities is available should students so desire, and help and guidance in appropriate choices will be provided. Students may opt to take the ‘sandwich year’ between Level 5 and 6. This offers considerable benefits to the students in terms of enhancement in their skills, adaptability and employability. The aim of the training year is to give students first-hand experience of current scientific practices in pharmaceutical or biomedical industry, health-related institutions, or in Science policy. This helps to reinforce what they have learnt and to provide a valuable addition to their curriculum vitae. In addition to the value of the work experience itself, the placement often improves future employment prospects.

Most students find their own placements but staff will be happy to help if necessary. A placement and Employability handbook that includes a list of relevant placement options will be available to students before enrolment. The placements officer briefs the students and provides support and advice in applying for positions, as well as maintaining a noticeboard where opportunities are posted.

During the placement, the student spends 40 weeks in industry or equivalent employment and the University continues to monitor student progress throughout the training period. The student is visited once or twice by a University supervisor working in close liaison with a supervisor in the place of work. The placement is assessed by a formal report approved by the placement supervisor and assessed as pass or fail by the internal supervisor.

Pathways, placements and option modules: At the end of L4, students will choose the career pathway they would like to follow, as well as option modules relevant for each career pathway. An optional pathway will only run if the minimum threshold for students ($n=8$) is recruited. Students who are interested in a pathway that does not reach its threshold will be offered an alternative pathway. It is their decision to accept the alternative offer. This information will be communicated to students before enrolment so that they will be made aware that the career pathway of their choice may not be available if certain modules have not reached the threshold to be provided, i.e. fewer than 8 students have enrolled. The three available career pathways are:

- (i) **Applied Medical Sciences:** students who choose this pathway may pursue careers in biomedical research or in clinical NHS or private health laboratories. Additionally, students who meet the requirements for graduate entry into Medical Schools, or the requirements of enrolling in a physician associate training program may apply to relevant Schools providing these courses. Optional modules available for students in the applied medical sciences include modules of clinical relevance such as "The Cardiovascular System", "Diabetes and Endocrine Disorders", "Neuroscience and Ageing" and the "Microbiome". Please see complete list in Table 1 above. Placements can be sought in NHS laboratories, health-related institutions or in biomedical-focused industries such as those working in small molecules, clinical research and monitoring, next-generation sequencing, diagnostics, blood stem cell & bone marrow transplantation. A comprehensive list of available placement options will be available in the placement handbook provided to students.
- (ii) **Pharmaceutical and Biotechnology Industry:** students who choose this pathway may pursue careers in the pharmaceutical, or biotechnology industry. Optional modules available for students in this career pathway include "Introduction to Pharmacology and Toxicology", "Entrepreneurship", "Drug Design and Development" and "Bioreactors". Please see complete list in Table 1 above. Placements can be sought at pharmaceutical or biotechnology companies that deal with technologies for drug discovery and development, Antibody production, Biologics, Cell Therapies, Cancer Drugs, Vaccines, RNAi, Gene Therapy and CAR-T cell therapy. A comprehensive list of available placement options will be available in the placement handbook provided to students.
- (iii) **Regulatory Sector/Science Policy:** Science Policy is "*an area of public policy which is concerned with the policies that affect the conduct of the science and research enterprise....often in pursuance of other national policy goals such as technological innovation, weapons development, health care and environmental monitoring. Science policy workers consider the ethical and political dimensions and how science and technology can best serve the public*" (The University of Edinburgh Careers Service). Optional modules available for students in this career pathway include "Current Perspectives in Bioscience", "Ethics and Law", "Legal Skills and Intellectual Property Rights" and "Public Health". Students pursuing careers in Science policy may seek placements in Scientific societies and charities such as CancerResearch UK., international organizations such as the International Council for Science, government bodies, and NGOs. Science communication is an essential skill required for this career pathway. This skill will be developed throughout several modules such as Skills for Biomedical Scientists, Project and Current Perspectives in Biosciences.

H. Course Modules

Table 2 shows the core and optional modules, and their assessment.

Table 2. Core and optional modules, and their assessment.

Module Code	Module Title	Level	Semester	Credit value	Assessment
	Chemistry for Life (Core)	4	1	20	40% CW (2 laboratory reports) 60% in-class MCQ test
	Biology of the Cell (Core)	4	1	20	60 % CW 40 % In-class MCQ test
	Biochemistry (Core)	4	1	20	100% CW 20% Oral presentation 80% MCQ test
	Microbiology (Core)	4	2	20	50 % Practical laboratory sessions 50% MCQ test
	Human Anatomy and Physiology (Core)	4	2	20	50 % CW 50% MCQ test
	Genetics and Molecular Biology (Core)	4	2	20	100% CW In-Class test
	Human Haematology and Immunology (Core)	5	1	20	100% CW In-Class test
	Bioinformatics and Biostatistics (Core)	5	1	20	60 % CW (2 * 30% problem solving tests) 40% Exam
	Public Health (Option)	5	1	20	100% CW 50% Oral presentation 50% Essay
	<i>Introduction to Pharmacology and Toxicology (Option)</i>	5	1	20	TBC
	<i>Stem Cells and Developmental Biology (Option)</i>	5	1	20	TBC
	Cellular Pathology and Imaging (Core)	5	2	20	60 % CW (2 * 20% practical tests, 20% quiz) 40% Exam
	Skills for Biomedical Scientists (Core)	5	2	20	100% CW (40% quiz, 60% research proposal)
	Cancer Biology and Therapy (Option)	5	2	20	50% CW (30% Laboratory practical test + 20% presentation) 50% Exam
	<i>The Cardiovascular System (Option)</i>	5	2	20	TBC
	<i>Bioreactors (Option)</i>	5	2	20	TBC
	<i>Ethics and Law (Option)</i>	5	2	20	TBC

	Research Project (Core)	6	1 & 2	40	100% CW
	Clinical Biochemistry and Blood Transfusion (Core)	6	1	20	40% Laboratory practical test 60% Exam
	Clinical Nutrition (Option)	6	1	20	40 % CW 60 % Exam
	<i>Diabetes and Endocrine disorders (Option)</i>	6	1	20	TBC
	<i>Drug Design and Development (Option)</i>	6	1	20	TBC
	Clinical OMICS and Precision Medicine (Core)	6	2	20	60 % CW (20% presentation, 20% report, 20% MCQ) 40% Practical
	Current Perspectives in Bioscience (Option)	6	2	20	100% CW (40% presentation, 60% essay)
	<i>Neuroscience and Aging (Option)</i>	6	2	20	TBC
	<i>The Microbiome (Option)</i>	6	2	20	TBC
	<i>Entrepreneurship (Option)</i>	6	2	20	TBC
	<i>Legal Skills and Intellectual Property Rights (Option)</i>	6	2	20	TBC

I. Timetable information

- Timetables will be provided to students via Moodle sites as soon as possible before the start of each semester.
- Typical contact hours for each week will range from 9 to 15 hours depending on the level of study and the modules that run in a semester. Modules that have laboratory sessions will normally have more contact time in a week than those without.
- Each module is timetabled for 1x3 hour block in a week (except those with laboratory sessions). Classes are never scheduled on a Wednesday afternoon, so students can take part in sports activities.

J. Costs and financial support

Course related costs

Costs that are in addition to the tuition fees in this course may include:

- The cost of text books and journal subscriptions.
- Student membership of relevant professional bodies and organisations such as the Institute of Biomedical Science.
- Costs related to subject specific seminars or conferences.
- Any extracurricular courses that a student wishes to take that are NOT provided and supported financially by the University, and accreditation applications.
- Travel to work placements.
- Uniforms and clothing may also be required to be purchased for placement activities.

Tuition fees/financial support/accommodation and living costs

- Information on tuition fees/financial support can be found by clicking on the following link - <http://www.lsbu.ac.uk/courses/undergraduate/fees-and-funding> or

List of Appendices

Appendix A: Curriculum Map

Appendix B: Embedding the Educational Framework for Undergraduate Courses

Appendix C: Terminology

Appendix A: Curriculum Map

This map provides a design aid to help course teams identify where course outcomes are being developed, taught and assessed within the course. It also provides a checklist for quality assurance purposes and may be used in validation, accreditation and external examining processes. Making the learning outcomes explicit will also help students to monitor their own learning and development as the course progresses. *T* is taught, *D* is developed, and *A* is assessed.

Key 1: T = Taught, i.e. contributing in some way to the Learning Outcomes; D = Developed i.e. a focus of the module; A = Assessed and therefore also developed

Key 2: L=Level, Modules in italics are optional modules

*D3:negotiation skills, and lifelong learning in the field of biomedical science including enterprise and knowledge transfer skills will be developed during the career workshop offered in level 4, and during optional modules in level 5 and 6.

A. Knowledge and understanding:

- A1. The basic biology of human health and disease represented by the disciplines of human anatomy and physiology, cellular, genetic and molecular biology, microbiology, chemistry and biochemistry;
- A2. Basic principles of laboratory-based diagnostic and analytical techniques used in clinical pathology, human haematology and immunology, clinical biochemistry and blood transfusion;
- A3. Aetiology, progression, and diagnosis of human diseases to support clinical management and treatment selection;
- A4. Bioinformatic and statistical principles for analysis of big data for the study of genomics, proteomics and transcriptomics, and their application in precision medicine;
- A5. Research design, quantitative/qualitative methods, critical review of evidence in the biomedical sciences, data interpretation, reporting, biosafety, ethics and conduct.

B. Intellectual skills:

- B1. Apply theories, paradigms, concepts or subject-specific principles to a new context;
- B2. Obtain and integrate lines of subject-specific evidence to formulate hypotheses, design experiments, critically evaluate data and use it to develop a research proposal;
- B3. Demonstrate independence of thought to identify the key features of a problem and suggest possible means of investigation;
- B4. Keep abreast of current insights in core and specialist areas of biomedical science;
- B5. Recognise the moral and ethical issues of investigations and appreciate the need for ethical standards and professional codes of conduct;
- B6. Synthesise, analyse and summarise a body of information and come to an informed and logically consistent conclusion.

C. Practical skills:

- C1. Demonstrate competence in the basic experimental skills relevant to cell and molecular biology, human anatomy and physiology, microbiology, cellular pathology and imaging, clinical biochemistry and blood transfusion;
- C2. Demonstrate knowledge of quality assurance and quality control principles, hazard identification, risk assessment and safety procedures associated with a particular technique or methodology;
- C3. Select and apply appropriate techniques, and evaluate alternative methodologies for an investigation or to complete a process;
- C4. Undertake practical investigations in a responsible, safe and ethical manner, while observing relevant health and safety regulations;
- C5. Organise and allocate duties, set targets and evaluate progress in achieving specific technical goals, evaluate own performance and performance of others within a team;
- C6. Use relevant numerical quantitative techniques and demonstrate competence in bioinformatic and statistical methods to validate, calibrate and analyse big data;
- C7. Present data in seminars or small-group tutorials to develop interpersonal skills such as information retrieval, problem-solving, communication and team working;
- C8. Demonstrate competence in the use of word-processors, spreadsheets; biological databases and data presentation packages.

E. Transferrable skills:

- D1. Identify individual and collective goals and responsibilities;
- D2. Develop the ability to work on one's own initiative, and manage one's own time to meet deadlines;
- D3. Develop negotiation skills, and lifelong learning in the field of biomedical science including enterprise and knowledge transfer skills;
- D4. Provide reflective and evidence-based solutions to problems;
- D5. Recognise and respect the views and opinions of other team members;
- D6. Evaluate their own performance as an individual and as a team member, as well as the performance of others;
- D7. Develop a flexible and effective approach to study and work;
- D8. Communicate ideas, arguments and concepts in a rational and systematic way, using a variety of media;
- D9. Clearly communicate in writing for both academic and lay audiences;
- D10. Use the full range of sources of information, citing references properly and avoiding plagiarism.

Appendix B: Embedding the Educational Framework for Undergraduate Courses

The Educational Framework at London South Bank University is a set of principles for curriculum design and the wider student experience that articulate our commitment to the highest standards of academic knowledge and understanding applied to the challenges of the wider world.

The Educational Framework reflects our status as University of the Year for Graduate Employment awarded by *The Times and The Sunday Times Good University Guide 2018* and builds on our 125 year history as a civic university committed to fostering social mobility through employability and enterprise, enabling our students to translate academic achievement into career success.

There are four key characteristics of LSBU's distinctive approach to the undergraduate curriculum and student experience:

- Develop students' professional and vocational skills through application in industry-standard facilities
- Develop our students' graduate attributes, self-awareness and behaviours aligned to our EPIIC values
- Integrate opportunities for students to develop their confidence, skills and networks into the curriculum
- Foster close relationships with employers, industry, and Professional, Statutory and Regulatory Bodies that underpin our provision (including the opportunity for placements, internships and professional opportunities)

The dimensions of the Educational Framework for curriculum design are:

- **informed by employer and industry** needs as well as professional, statutory and regulatory body requirements
- **embedded learning development** for all students to scaffold their learning through the curriculum taking into account the specific writing and thinking requirements of the discipline/profession
- **high impact pedagogies** that enable the development of student professional and vocational learning through application in industry-standard or authentic workplace contexts
- **inclusive teaching, learning and assessment** that enables all students to access and engage the course
- **assessment for learning** that provides timely and formative feedback

All courses should be designed to support these five dimensions of the Educational Framework. Successful embedding of the Educational Framework requires a systematic approach to course design and delivery that conceptualises the student experience of the curriculum as a whole rather than at modular level and promotes the progressive development of understanding over the entire course. It also builds on a well-established evidence base across the sector for the pedagogic and assessment experiences that contribute to high quality learning.

This appendix to the course specification document enables course teams to evidence how their courses meet minimum expectations, at what level where appropriate, as the basis for embedding the Educational Framework in all undergraduate provision at LSBU.

Dimension of the Educational Framework	Minimum expectations and rationale	How this is achieved in the course
Curricula informed by employer and industry need	<p><u>Outcomes focus and professional/employer links</u></p> <p>All LSBU courses will evidence the involvement of external stakeholders in the curriculum design process as well as plan for the participation of employers and/or alumni through guest lectures or Q&A sessions, employer panels, employer-generated case studies or other input of expertise into the delivery of the course provide students with access to current workplace examples and role models. Students should have access to employers and/or alumni in at least one module at level 4.</p>	The course has been informed by the QAA Biomedical Sciences Benchmarks (2015). Students are required to identify career opportunities in during a workshop at level 4 and during the Skills for Biomedical Scientists module at level 5, as part of their 'partnership' with the personal tutor. We will expose the students to skill requirements of employers via guest speakers, industrial visits, engagement with professional scientists. Students may take advantage of a year placement in industry and qualify for a sandwich award.
Embedded learning development	<p><u>Support for transition and academic preparedness</u></p> <p>At least two modules at level 4 should include embedded learning development in the curriculum to support student understanding of, and familiarity with, disciplinary ways of thinking and practising (e.g. analytical thinking, academic writing, critical reading, reflection). Where possible, learning development will be normally integrated into content modules rather than as standalone modules. Other level 4 modules should reference and reinforce the learning development to aid in the transfer of learning.</p>	There is particular emphasis within Bioinformatics and Biostatistics, and Skills for Biomedical Scientists modules on the development of a portfolio of learning and scientific practice. This will include basic scientific, mathematical and statistical techniques, communication skills, and ICT. Progression is made from level 4 and 5 to more in-depth data interpretation and use of more detailed analysis techniques via the Project module at level 6.
High impact pedagogies	<p><u>Group-based learning experiences</u></p> <p>The capacity to work effectively in teams enhances learning through working with</p>	Projects and group work are facilitated in lectures, practical and tutorial sessions. These are not all

	<p>peers and develops student outcomes, including communication, networking and respect for diversity of perspectives relevant to professionalism and inclusivity. At least one module at level 4 should include an opportunity for group working. Group-based learning can also be linked to assessment at level 4 if appropriate. Consideration should be given to how students are allocated to groups to foster experience of diverse perspectives and values.</p>	<p>formally assessed but serve as important components of students' experiential learning through peer learning, presentation and communication skills. The development of the learning portfolio starts at the Chemistry for Life module, at level 4, through Skills for Biomedical Scientists at level 5. There is substantial opportunity for development of interpersonal skills in the final year Project as student's network with other stakeholder in the research process including external organisations.</p>
Inclusive teaching, learning and assessment	<p><u>Accessible materials, resources and activities</u></p> <p>All course materials and resources, including course guides, PowerPoint presentations, handouts and Moodle should be provided in an accessible format. For example, font type and size, layout and colour as well as captioning or transcripts for audio-visual materials. Consideration should also be given to accessibility and the availability of alternative formats for reading lists.</p>	<p>This is achieved via the Module Moodle sites. Staff will upload a range of learning resources to support student learning. All students enrolled on a module will have access to the Moodle site and all module materials.</p>
Assessment for learning	<p><u>Assessment and feedback to support attainment, progression and retention</u></p> <p>Assessment is recognised as a critical point for at risk students as well as integral to the learning of all students. Formative feedback is essential during transition into university. All first semester modules at level 4 should include a formative or low-stakes summative assessment (e.g. low weighted in final outcome for the module) to provide an early opportunity for students to check progress and receive prompt and useable feedback that can feed-forward into future learning and assessment. Assessment and feedback communicates high expectations and develops a commitment to excellence.</p>	<p>Students experience variety of assessments during their first year, including testing of their proficiency in Mathematics in the Chemistry for Life Sciences module, and in English and Mathematics as they commence the Skills for Biomedical Scientists module at level 5. These modules provide a structure for greater use of formative or formative-to-summative assessment.</p>
High impact pedagogies	<p><u>Research and enquiry experiences</u></p> <p>Opportunities for students to undertake small-scale independent enquiry enable</p>	<p>Modules featuring research projects and practical activities include Biology of the Cell, Biochemistry,</p>

	<p>students to understand how knowledge is generated and tested in the discipline as well as prepare them to engage in enquiry as a highly sought after outcome of university study. In preparation for an undergraduate dissertation at level 6, courses should provide opportunities for students to develop research skills at level 4 and 5 and should engage with open-ended problems with appropriate support. Research opportunities should build student autonomy and are likely to encourage creativity and problem-solving. Dissemination of student research outcomes, for example via posters, presentations and reports with peer review, should also be considered.</p>	<p>Genetics and Molecular Biology, Microbiology, Cellular Pathology and Imaging, Bioinformatics and Biostatistics, Skills for Biomedical Scientists, Clinical Biochemistry and Blood Transfusion, as well as Clinical OMICS and Precision Medicine. Many of these knowledge and skills are brought together to complete the final year Project.</p>
Curricula informed by employer and industry need / Assessment for learning	<p>Authentic learning and assessment tasks</p> <p>Live briefs, projects or equivalent authentic workplace learning experiences and/or assessments enable students, for example, to engage with external clients, develop their understanding through situated and experiential learning in real or simulated workplace contexts and deliver outputs to an agreed specification and deadline. Engagement with live briefs creates the opportunity for the development of student outcomes including excellence, professionalism, integrity and creativity. A live brief is likely to develop research and enquiry skills and can be linked to assessment if appropriate.</p>	<p>There is substantial opportunity for development of professional skills in the final year dissertation as students liaise with support staff, subjects and outside bodies. The dissertation also furthers the skills of data collection, interpretation and analysis, as well as presentation skills. Similar opportunities for development of life long learning, knowledge transfer, and negotiation skills exist in the optional module of Enterpreunership, as well as in work-placement year for the sandwich program.</p>
Inclusive teaching, learning and assessment	<p>Course content and teaching methods acknowledge the diversity of the student cohort</p> <p>An inclusive curriculum incorporates images, examples, case studies and other resources from a broad range of cultural and social views reflecting diversity of the student cohort in terms of, for example, gender, ethnicity, sexuality, religious belief, socio-economic background etc. This commitment to inclusivity enables students to recognise themselves and their experiences in the curriculum as well as</p>	<p>Staff use a range of materials in the delivery of their courses that include images and video. Consideration is also given to cultural, religion and gender diversity.</p>

	foster understanding of other viewpoints and identities.	
Curricula informed by employer and industry need	<p>Work-based learning</p> <p>Opportunities for learning that is relevant to future employment or undertaken in a workplace setting are fundamental to developing student applied knowledge as well as developing work-relevant student outcomes such as networking, professionalism and integrity. Work-based learning can take the form of work experience, internships or placements as well as, for example, case studies, simulations and role-play in industry-standards settings as relevant to the course. Work-based learning can be linked to assessment if appropriate.</p>	Students are required to identify career opportunities during the career workshop planned at level 4, and in Skills for Biomedical Scientists as part of their 'partnership' with the personal tutor at level 5. Students will participate in industrial visits in a wide sense and network with professional scientists at level 5 and 6. Students will also be encouraged to participate in the University Ambassador scheme.
Embedded learning development	<p>Writing in the disciplines: Alternative formats</p> <p>The development of student awareness, understanding and mastery of the specific thinking and communication practices in the discipline is fundamental to applied subject knowledge. This involves explicitly defining the features of disciplinary thinking and practices, finding opportunities to scaffold student attempts to adopt these ways of thinking and practising and providing opportunities to receive formative feedback on this. A writing in the disciplines approach recognises that writing is not a discrete representation of knowledge but integral to the process of knowing and understanding in the discipline. It is expected that assessment utilises formats that are recognisable and applicable to those working in the profession. For example, project report, presentation, poster, lab or field report, journal or professional article, position paper, case report, handbook, exhibition guide.</p>	Students are required to develop a learning portfolio as part of the outcomes from the Skills for Biomedical Scientists module at level 5. This facilitates development of scientific writing, practical reporting and research skills, and provides students with opportunities to develop their writing in literature review, research proposal, and ethics application. The final year Project requires students to develop skills in scientific write-up and presentation and discussion of results.
High impact pedagogies	<p>Multi-disciplinary, interdisciplinary or interprofessional group-based learning experiences</p> <p>Building on experience of group working at level 4, at level 5 students should be</p>	This is achieved in the degree programme through assessments that require students to work in groups on mini research projects and laboratory assessments. The

	<p>provided with the opportunity to work and manage more complex tasks in groups that work across traditional disciplinary and professional boundaries and reflecting interprofessional work-place settings. Learning in multi- or interdisciplinary groups creates the opportunity for the development of student outcomes including inclusivity, communication and networking.</p>	<p>final year project encourages students to carry out an interdisciplinary research investigation linked either to the research interests of the academic team or, with approval from an academic, their own research question.</p>
Assessment for learning	<p><u>Variation of assessment</u></p> <p>An inclusive approach to curriculum recognises diversity and seeks to create a learning environment that enables equal opportunities for learning for all students and does not give those with a particular prior qualification (e.g. A-level or BTEC) an advantage or disadvantage. An holistic assessment strategy should provide opportunities for all students to be able to demonstrate achievement of learning outcomes in different ways throughout the course. This may be by offering alternate assessment tasks at the same assessment point, for example either a written or oral assessment, or by offering a range of different assessment tasks across the curriculum.</p>	<p>A variety of assessment is used at level 4, including essays, problem solving exercises, Moodle quizzes, and unseen written exams. Thereafter, level 5 and 6 assessment is a combination of examination, a variety of coursework, including presentations, essays, case studies, in-class tests, and a final year dissertation.</p>
Curricula informed by employer and industry need	<p><u>Career management skills</u></p> <p>Courses should provide support for the development of career management skills that enable student to be familiar with and understand relevant industries or professions, be able to build on work-related learning opportunities, understand the role of self-appraisal and planning for lifelong learning in career development, develop resilience and manage the career building process. This should be designed to inform the development of excellence and professionalism.</p>	<p>Students are required to identify career opportunities during the career workshop provided at level 4, and in the Skills for Biomedical Scientists as part of their 'partnership' with the personal tutor. Modules at level 5 and 6 will develop the students' skills as reflective practitioners and encourage their career planning. Students will participate in industrial visits in a wide sense and network with professional scientists at level 5 and 6.</p>
Curricula informed by employer and industry need / Assessment for learning /	<p><u>Capstone project/dissertation</u></p> <p>The level 6 Project or dissertation is a critical point for the integration and synthesis of knowledge and skills from across the course. It also provides an important transition into employment if the</p>	<p>The final year Project requires students to develop skills in:</p> <p>(1) Identification of the significance of research and formulation of hypotheses;</p>

High impact pedagogies	<p>assessment is authentic, industry-facing or client-driven. It is recommended that this is a capstone experience, bringing together all learning across the course and creates the opportunity for the development of student outcomes including professionalism, integrity and creativity.</p>	<p>(2) Design, justification and implementation of approaches to testing (giving consideration to sample population, reliability, validity and statistical analysis); (3) Scientific write-up, presentation and discussion of results; (4) Maintaining contemporaneous records and notes.</p>
------------------------	--	---

Appendix C: Terminology

The following is a list of terminologies used in the context of the BSc (Hons) Biomedical Science Course:

Awarding body	a UK higher education provider (typically a university) with the power to award higher education qualifications such as degrees
Bursary	a financial award made to students to support their studies; sometimes used interchangeably with 'scholarship'
Collaborative provision	a formal arrangement between a degree-awarding body and a partner organisation, allowing for the latter to provide higher education on behalf of the former
Compulsory module	a module that students are required to take
Contact hours	the time allocated to direct contact between a student and a member of staff through, for example, timetabled lectures, seminars and tutorials
Coursework	student work that contributes towards the final result but is not assessed by
Current students	students enrolled on a course who have not yet completed their studies or been awarded their qualification
Delivery organisation	an organisation that delivers learning opportunities on behalf of a degree-awarding body
Distance-learning course	a course of study that does not involve face-to-face contact between students and delivery organisations
Extracurricular	activities undertaken by students outside normal curriculum
Feedback (on assessment)	advice to students following their completion of a piece of assessed or examined work.
Formative assessment	a type of assessment designed to help students learn more effectively, to progress in their studies and to prepare for summative assessment; formative assessment does not contribute to the final mark, grade or class of degree awarded to students
Higher education provider	organisations that deliver higher education.

Independent learning	learning that occurs outside the classroom that might include preparation for scheduled sessions, follow-up work, wider reading or practice, completion of <u>assessment tasks or revision</u>
Lecture	a presentation or talk on a particular topic; in general lectures involve larger groups of students than <u>seminars and tutorials</u>
Learning zone	a flexible student space that supports independent and social learning
Material information	information students need to make an informed decision, such as about what and <u>where to study</u>
Mode of study	different ways of studying, such as full-time, part-time, e-learning or work-based learning
Modular course	a course delivered using modules
Module	a self-contained, formally structured unit of study, with a coherent and explicit set of learning outcomes and assessment criteria; some providers use the word 'course' or 'course unit' to refer to individual <u>modules</u>
National teaching fellowship	a national award for individuals who have made an outstanding impact on student learning and the teaching profession
Optional module	a module or course unit that students choose to take
Professional body	an organisation that oversees the activities of a particular profession and represents
Prospective student	those applying or considering applying for any programme, at any level and employing any mode of study, with a higher education provider
Regulatory body	an organisation recognised by government as being responsible for the regulation or approval of a particular range of issues and activities
Scholarship	a type of bursary that recognises academic achievement and potential, and which is sometimes used interchangeably with 'bursary'
Semester	either of the parts of an academic year that is divided into two for purposes of teaching and assessment (in contrast to division into terms)

Seminar	seminars generally involve smaller numbers than lectures and enable students to engage in discussion of a particular topic and/or to explore it in more detail than might be covered in a lecture
Summative assessment	formal assessment of students' work, contributing to the final result
Term	any of the parts of an academic year that is divided into three or more for purposes of teaching and assessment (in contrast to <u>division into semesters</u>)
Total study time	the total time required to study a module, unit or course, including all class contact, independent learning, revision and assessment
Tutorial	one-to-one or small group supervision, feedback or detailed discussion on a particular topic or project
Work/study placement	a planned period of experience outside the institution (for example, in a workplace or at another higher education institution) to help students develop particular skills, knowledge or understanding as part of their course
Written examination	a question or set of questions relating to a particular area of study to which candidates write answers usually (but not always) under timed conditions
